

BCA Benefits and Assumptions Summary

The Plymouth Multimodal Center generates a variety of benefits, ranging from monetary such as increased transit fare revenue, to social such as reduced emissions. Accounting for various costs that are realized over a 20-year period involves making assumptions based on current available data and anticipated trends over time. The bulk of the calculation of benefits in the BCA is based on the assumed growth of GATRA ridership due to the improved Plymouth Multimodal Center, and the four new routes made possible through the Project. As a result of the Project, existing GATRA routes will become more attractive to riders, increasing ridership on existing routes. The combination of net new riders to existing routes, and riders of new routes, serves as a base for calculating the following benefits:

- Transit revenue
- Travel time savings
- Tourism spending
- Reduced Emissions Net Non CO2
- Reduced Emissions Social Cost of Carbon
- Auto operating cost savings

The increase in transit riders on each route were developed based on annual transit riders on the four existing routes, with data provided by GATRA. The new ridership for the three proposed routes is based on daily one-way person trips and operating days per year, with data also provided by GATRA and the Southeastern Regional Planning and Economic Development District (SRPEDD) - the regional planning agency serving GATRA. The annual ridership for each existing route was grown at 5% per year for a no build scenario. For a build scenario ridership was grown by 10% for the first two years after the completion of construction in 2019, and 5% thereafter.

Operating costs and revenues associated with the Project were developed by Project partners in consultation with MassDevelopment, and are included in the BCA. Assumptions regarding parking revenue, operating costs, and other factors are preliminary and will be refined as the Project progresses, but are appropriate for the 30 percent design level. Assumptions and sources for the benefits are provided below.

Criteria	Benefit(s)	Inputs	Assumptions
State of Good Repair	Value of Land The town of Plymouth is donating the land for the project site	Existing lot value of Memorial Drive Parking lot Value of property upon project completion Net annual increase in property	 \$650,000 value of Memorial Drive parking lot based on 2012 Site Selection Study, Appendix J – Financial Feasibility, plus appreciation of 3% per year from 2011 when estimate was made, to 2015 when Project cost estimate was established. This cost is addressed as an in-kind donation by the Town of Plymouth as a Project Partner Multiplier of four used for improved value of property, based on Franklin Regional Transit Center, Greenfield, MA case study. Property value appreciation at 3%/year. Net increase included as a benefit
	Value of Rent Savings for bus area GATRA will not pay rent for the 600 SF passenger waiting area	Value of GATRA Lease Annual rent increase	 600 SF passenger waiting area Value of rent saved is estimated to be \$20/SF, or \$12,000 in the first year (MassDevelopment Proforma for commercial space) Annual rent increase of 3%/year
	Transit Revenue Growth in riders will generate additional farebox revenue	 Assumed fare box revenue in 2019 Net new transit riders for existing routes and new transit riders on new routes 	 2014 GATRA fare is \$1.00 and fare is assumed to be \$1.25 at project completion in 2019 Fare increase of 5% every 5 years Fare structure provided by GATRA
	Parking Revenue Additional parking will increase revenue	 Gross revenues from parking garage and new Court Street area meters Annual increase in revenue 	 Gross parking revenues based on PGCD and Mass Development Operating Proforma Total revenue of \$712,300 in first year Annual increase of 3%/year
Economic Competitiveness	Travel time savings 1. Increased route efficiency saves passenger time due to ease of transfer	 Value of travel time savings Net new riders on existing routes and new riders on proposed routes 	Travel time savings determined based on the amount of time saved by riding a bus vs. walking a route, based on average driving and walking speeds.

	New routes provide people with the choice of riding transit over walking, which will reduce their travel time, particularly between the waterfront and uphill locations on Court Street. Tourism appelling from pow transit sortion.		 Assumed one mile (.3 hours) is saved by using the seasonal circulator Assumed 10 minutes (.17 hours) saved for riders on existing routes Value of travel time based on TIGER BCA Resource Guide at \$13.00 per hour for all local travel purposes
	Tourism spending from new transit service Downtown Plymouth will be made more accessible to people who will spend more money on retail goods and at attractions	 New transit riders on Seasonal Circulator Number of visitors to downtown Plymouth Amount of time spent in downtown Plymouth Retail expenditures and the value of tourism expenditure per site Increase per year in spending 	 The Seasonal Circulator route is expected to increase tourism spending. Other routes may also increase tourism spending, but are not included in the BCA due to qualitative benefits. Assumed 6,667 daily visitors to downtown Plymouth based on 1,000,000 visitors to downtown attractions per year and a tourist season of five months, or 150 days (Plymouth 400) Assumed three hour stay in downtown Plymouth (based on Plymouth Convention Center and Visitor's Bureau's (PCCV) data) of four-hour average stays in Plymouth. The four hours may include sites away from downtown, such as Plymouth Plantation, so a three hour stay downtown was assumed for this calculation. Assumed 30% of visitors arrive by bus, based on estimates by PCCV. These visitors are dependent on local transit provided by GATRA, pedestrian and bicycle amenities provided by the Project. Expenditures based on a \$6.00 average price of adult admission to 6 main attractions and average expenditure of \$25.00 at retail locations, based on Plymouth 400 estimates. 3% increase in spending per year
Quality of Life/ Environmental Sustainability	Reduced emissions – Net Non Co2 from new transit routes	 Total Emissions Value of VOC Savings Total Emissions Value of NOx Savings 	Summer reduction of VOC and NOx per year in kg, estimated based on daily person trips by route (from Southeastern Regional Planning and Economic Development District (SRPEDD))

Improved air quality is a social benefit and will enhance quality of life for residents and tourists Reduced emissions – Net Non Co2 from additional riders on existing routes Improved air quality is a social benefit and will enhance quality of life for residents and tourists	 Total Emissions Value of VOC Savings Total Emissions Value of NOx Savings 	extrapolated for 20 years and SRPEDD CMAQ New Bus Service Air Quality Analysis worksheet developed in 2015 VOC and NOx value per short ton, based on TIGER BCA resource guide (3/27/15) for all local travel purposes. Summer reduction of VOC and NOx per year in kg, estimated based on net new daily person trips by route (estimated from annual net new riders) and SRPEDD CMAQ New Bus Service Air Quality Analysis worksheet, modified to not include bus emissions, as existing routes are already running
Reduced emissions – Social cost of carbon from new routes Improved air quality is a social benefit and will enhance quality of life for residents and tourists	Total Emissions value of winter CO2 and Summer CO2 Social cost of carbon discount rate	 VOC and NOx value per short ton, based on TIGER BCA resource guide (3/27/15) for all local travel purposes. Winter and summer reductions of CO2 per year in kg, estimated based on daily person trips by route (from SRPEDD) extrapolated for 20 years and SRPEDD CMAQ New Bus Service Air Quality Analysis worksheet Conversion factor of 1000 kg/metric ton, based on TIGER BCA resource guide (3/27/15) for all local travel purposes.
Reduced emissions – Social cost of carbon from additional riders on existing routes Improved air quality is a social benefit and will enhance quality of life for residents and tourists	 Total Emissions value of winter CO2 and Summer CO2 Social cost of carbon discount rate 	 Social cost of carbon discount rate of 3% per year in 2013 dollars, based on TIGER BCA resource guide (3/27/15) Winter and summer reductions of CO2 per year in kg, estimated based on net new daily person trips by route (estimated from annual net new riders) and SRPEDD CMAQ New Bus Service Air Quality Analysis worksheet, modified to not include bus emissions, as existing routes are already running on TIGER BCA resource guide (3/27/15) for all local travel purposes. Social cost of carbon discount rate of 3% per year in 2013 dollars, based on TIGER BCA resource guide (3/27/15)

Economic Competitiveness	Job creation A new multimodal center will increase GATRA service and number of the employment opportunities directly related to the transit center Additional job creation will likely create secondary benefits not included in BCA	 Number of new jobs created for GATRA Service GATRA Annual salary Annual wage increase 	 Assumed new routes add seven new drivers. Annual salary of \$36,354.24 based on GATRA hourly rate of \$19.42 and 36 hours per week, 52 weeks a year Annual wage increase of 2.5%
	Commercial space revenue Increased commercial space will lead to an increase in rental revenue	 Effective Gross Revenues from commercial operations Rent growth per year 	 Rental Revenues and Operating expense assumptions from PGDC and Mass Development Commercial Operating Proforma, starting at \$84,900 in year one Rent growth per year of 3%
	Auto operating cost savings An increase in transit trips also results in a decrease in auto trips for those trips that are assumed to be diverted from cars to transit. This results in a reduced cost for auto operations.	 Vehicle occupancy for standard and seasonal/tourist trips Percentage of transit riders diverted from vehicles on existing routes and new routes Net new diverted auto trips derived from net new riders on existing routes, and newly diverted auto trips derived from new riders on proposed routes VMT of net new diverted auto trips Vehicle operating costs 	 Assumed vehicle occupancy of 1.06 for standard trips (SRPEDD) Assumed vehicle occupancy of 3.0 for seasonal/tourist routes in Plymouth (Plymouth Transportation Center Site Selection Study) 100% of transit riders diverted from vehicles on two new year-round routes (SRPEDD) 25% of transit riders diverted from vehicles on existing routes and new Seasonal Circulator route, as new riders are less likely to all shift from driving Assumed diverted VMT is 50% of existing routes and 100% of new routes Assumed vehicle operating costs of \$0.592 per mile, based on American Automobile Association 2014 "Your Driving Costs" for average sudan driven 15,000 miles per year Assumed 3% increase per year in operating costs

Passenger vehicles per year - http://www.epa.gov/cleanenergy/energy-resources/refs.html

Passenger vehicles are defined as 2-axle 4-tire vehicles, including passenger cars, vans, pickup trucks, and sport/utility vehicles.

In 2011, the weighted average combined fuel economy of cars and light trucks combined was 21.4 miles per gallon (FHWA 2013). The average vehicle miles traveled in 2011 was 11,318 miles per year.

In 2011, the ratio of carbon dioxide emissions to total greenhouse gas emissions (including carbon dioxide, methane, and nitrous oxide, all expressed as carbon dioxide equivalents) for passenger vehicles was 0.988 (EPA 2013a, EPA 2013b)

The amount of carbon dioxide emitted per gallon of motor gasoline burned is 8.89 × 10³ metric tons, as calculated in the "Gallons of gasoline consumed" section above.

3% increase per year

Assuming 1,000,000¹ visitors to downtown attractions per year and a tourist season of 5 months (150 days), it is estimated that an average of 6,667 people visit downtown Plymouth daily. We assumed each visitor stayed about 3 hours in the downtown area. According to the Plymouth Convention Center and Visitor's Bureau, the average visitor stays in Plymouth for 4 hrs¹, but not all of that time is spent in the $downtown \ (i.e.\ some\ time\ is\ spent\ at\ Plymouth\ Plantation\ and\ other\ non-downtown\ attractions).$

The Plymouth Convention Center and Visitor's Bureau estimated that approximately 30% of visitors arrive by bus.

Summary of Vehicle Emission Rates:

Emission Rates by Vehicle Type	Milestone Year for Rates	Oper. Speed (mph)	Summer VOC (grams/mile)	Summer NOx (grams/mile)	Winter CO (grams/mile)	Summer CO2 (grams/mile)	
Auto	2016	20	0.280	0.215	11.340	368.1	
Bus*	2016	18	0.231	1.016	0.46	997.9	
HDDV 4	Vehicle type used for Bus emission factors (For example, HDGV 6 or HDDV 2b)						

^{*}Please refer to the 'Emission Factors' tab to determine the most appropriate 'Bus' factors based on fuel type and gross vehicle weight. If you require 'Bus' factors for an operating speed other that 18MPH, or for 'Auto' factors other than 20 MPH, please contact Ethan Britland at 857-368-8840 or at Ethan Britland@state.ma.us

Calculate VMT and emissions savings from private vehicles:

Convert daily bus ridership into private auto VMT savings:

person trips (reduced)	occupancy	auto trips	length (miles)	auto VMT		
9.0	1.06	8	3.7	31		
Calculate emissions cha Pollutant	inge from auto VMT savi	ings:	Daily Auto VMT change (net)	X Emission factor (auto)	/ 1000g per kg	= change/day in kg
Summer VOC			-31	0.280	1000	-0.009
Summer NOx			-31	0.215	1000	-0.007
Winter CO			-31	11.340	1000	-0.356
Summer CO2			-31	368.100	1000	-11.564

Daily one way / average veh. = daily one-way x avg. auto trip = daily savings

Calculate bus route	Calculate bus route mileage and emissions per day:									
Pollutant	Total Route distance (miles)	X # of round trips per day	= fleet miles per day	X Emission factor (bus)	/ 1000g per kg	= change/day in kg				
Summer VOC	3.70	12	44	0.231	1000	0.000				
Summer NOx	3.70	12	44	1.016	1000	0.000				
Winter CO	3.70	12	44	0.460	1000	0.000				
Summer CO2	3.70	12	120	997.900	1000	0.000				

Add impact of bus emissions to emission savings from private vehicles

Pollutant	change/day auto (kg)	+ change/day bus or van (kg)	= change/day (NET) in kg
Summer VOC	-0.009	0.000	-0.009
Summer NOx	-0.007	0.000	-0.007
Winter CO	-0.356	0.000	-0.356
Summer CO2	-11.564	0.000	-11.564
Calculate net emissions change in kilograms per year (s	seasonally adjusted)		
D. H. c.
